TITLE: A Magnetic Station With a Quartz Microvariometer

PERIODICAL: V sb.: "Vozmushcheniya elektromagnitn. polya Zemli". Moscow, AN SSSR
1960, pp. 57-62 (English summary)

TEXT: It is reported on the development and designing of a magnetic micro-
variation station on the basis of the low-inertial quartz variometer which was
proposed by V. F. Shel'ting (see abstr. No. 2015). The station is intended for
continuous recording of the variations of all three components of the Earth's mag-
netic field with amplitudes of the order of 10^{-7} oe and more, and duration of from
1 sec. to many minutes. The equipment consists of three main assemblies: 1) the
microvariometers of X, Y, Z; 2) the photographic recorder with 200 mm in paper
width and 90 mm/hr in speed, which has also a device marking the time; 3) an
automatic band switch relay operated by two photoresistances and permitting the
rays to return in jump onto the phototape after reflection from the microvariometer

Card 1/2

mirror in case of its departure from the tape under the effect of an intense variation of the field. If operating with the automatic banswitch relay, large angular deflections of the moving system of the responsive element are excluded, which is important for the stabilization of the graduation value. As a result of the tests of the station, which were conducted in autumn 1957, it turned out that: 1) the moment of inertia of the moving system is equal to 10^{-5} g cm²; 2) the natural periods of the oscillations of the different variometers lie within the limits of $T_0 \approx 1 - 2$ sec at a graduation value of the order of $\varepsilon \approx 0.05$ γ/arc minute; 3) the magnetic moments of the moving magnets amount to about $m = 0.5 - 1$ electromagnetic units; 4) the shape of the frequency characteristic of the device testifies that the graduation value is constant for all periods longer than two or three seconds and does not depend on the period of the perturbing force; 5) the amplitude characteristic is linear within the limits of the scale width. There are 7 references.

TITLE: Prefabricated Reinforced Concrete Grate Structures for Protective and Regulating Constructions on Mountain and Foot Hill Rivers (Sbcernoreshetchatyye zhelezobetonnyye konstruktsii zashchitnykh i vypravitel'nykh sooruzheniy na gornyx i predgornyx rekakh)

PERIODICAL: Gidrotekhnika i melioratsiya, 1958, Nr 9, pp 43-48 (USSR)

ABSTRACT: The author describes new prefabricated reinforced concrete grate structures for protective and regulating constructions on Caucasian and Transcaucasian mountain rivers devised by him and manufactured by the Zakmetallurgstroy. There are 2 types of structural elements used for these structures: 1) a reinforced concrete beam with thickened ends with a hole in the center (fig. 1). Frames of any given or required height can be assembled from these two parts and transformed into a monolithic construction by driving an old rail through the holes and into the soil. The holes are then filled with a cement solution or plastic concrete 250. Fig. 2 and 3 show different types of such frames which could be used for the construction of spurs or longitudinal girdles. The manu-

TITLE: Role played by tunnel-diode capacitance in some transistor circuits

SOURCE: AN LatSSR. Institut elektroniki i vy*chislitel'noy tekhniki. Trudy*, v. 4, 1963, 167-170

TOPIC TAGS: tunnel diode, tunnel-diode capacitance, transistor circuit, tunnel-diode-transistor cell, logical element

ABSTRACT: Capacitor charging in a tunnel-diode-transistor cell, specifically the effect of capacitance on the switching time, is theoretically considered in this article. For a simple common-emitter transistorized amplifier with a tunnel-diode resistor R_K and capacitor C output, this approximate formula for the maximum charging current i_{12}^{\max} is developed:

Card 1/2

ACCESSION NR: AT3007312

$$i_{12}^{\max} \approx \frac{U_0}{R_A + R_{12} + \frac{C_0}{C} R_{12}}$$

where U_0 is the applied d-c voltage, R_{12} is the initial tunnel-diode resistance, and C_0 is the capacitance shunting that resistance in a diode equivalent circuit. The formula shows that, with high R_k , the diode capacitance C_0 plays a negligible role. The formula holds true for frequencies of up to several mc. For higher frequencies, an exact formula is offered. Orig. art. has: 3 figures and 9 formulas.

TITLE: The effect of tunnel diode load on the sliding process

SOURCE: AN LatSSR. Institut elektroniki i vychislitel'noy tekhniki. Trudy, v. 8, 1965. Avtomatiki i vychislitel'naya tekhnika, 167-183

TOPIC TAGS: tunnel diode, semiconductor device, circuit theory, transistor

ABSTRACT: In numerous practical circuits containing semiconductor diodes one observes a sliding of the operating point along the positive branches of the characteristic during discharges of the capacitors, inductors, or any other element storing potential energy. The paper investigates the influence of various loads on this sliding process with special emphasis on the case when such a load is represented by a diode or a transistor. It presents a model of the semiconductor diode recovery which is quite satisfactory for all practical purposes; the respective theoretical curves were confirmed by oscillograms. Significant errors are noticeable only towards the end of the discharge process when the resistivity of the semiconductor material becomes comparable to the discharge resistance because of the escape of minority current carriers. A simple expression is obtained for the determination of the sliding time when the load is made of a diode or a transistor operating under deep

TITLE: Thermodynamic study of the distribution of microquantities of strontium between barium hydrophosphate and the solution

SOURCE: AN SSSR. Doklady v. 166, no. 3, 1962, 658-659

TOPIC TAGS: strontium compound, barium compound, phosphate, thermodynamic calculation

ABSTRACT: A thermodynamic study of the cocrystallization of strontium with barium hydrophosphate was carried out. An electrolytic method was employed to establish the distribution of the $BaHPO_4-SrHPO_4-H_2O$ system under the conditions of cocrystallization of the deposit is achieved which promotes the cocrystallization. The cocrystallization factor D was determined by using a linear relationship and the equilibrium constant (0.31) at low ionic strengths of the solution. The solubility products of $BaHPO_4$ and $SrHPO_4$ were determined by use of 10^{-12} and found to be 1.6×10^{-28} and Card 1/2 UDC: 541.123.4

TITLE: Heat of formation of titanium nitrides as a function of their composition

SOURCE: Zhurnal fizicheskoy khimii, v. 40, no. 5, 1966, 1125-1128

TOPIC TAGS: titanium compound, heat of formation, nitrogen compound, calorimetry

ABSTRACT: The dependence of the heat of formation of titanium nitrides upon composition was studied by calorimetric combustion technique. Homogeneous samples of titanium oxides ranging from $TiN_{0.14}$ to $TiN_{0.98}$ were prepared by calcining Ti metal in the presence of nitrogen at $1100^{\circ}C$. For nitride samples of a general formula TiN_xO_y ($y = 0.01-0.02$) suitable corrections were made in order to account for the oxygen content. The dependence of the heat of formation upon nitrogen content (x index in the formula) is shown in Fig. 1 where: 1 - is for titanium nitrides and 2 - is for lower oxides of titanium. It was found that within the range of
